

The Genetics of Cattle (Cabi)

Within the past two decades, new methods created by molecular genetics and cytogenetics as well as quantitative genetics have greatly enlarged the amount and quality of genetic information available in domestic mammals. Cattle have been significantly involved in this process, particularly due to the large impact of new knowledge and methods on the economy and culture of numerous countries for both meat and milk production. As demands for these goods increase, modern genetic technologies in immunogenetics, cytogenetics, biochemical and molecular genetics create optimistic expectations for the future.
